ABSTRACT:

PURPOSE: To simplify the facility of each reception station and to reduce running
cost by downloading the music program read from the data base provided on a
transmission station with video signals and character information to each reception
station by utilizing a communication satellite line.

CONSTITUTION: On a transmission side, video and sound signals are read from a data
base 1, the signals are reproduced in an automatic playing part 2, the video and
sounds signals are outputted, the character information from a character program
preparation part 6 is superposed on the video signals in an information
superposition part 3, the sound signals are multiplexed on the video signals, the
signals are outputted and they are transmitted to a communication satellite in a CS
transmission part 7. On a reception side, the radio waves from the communication
satellite are received by a CS reception part 10, the reception signals are
demodulated in a demodulation part 11, video and sound signals and character
information are extracted, they are outputted, the outputs are stored in plural
signal storage parts 12a, etc., the outputs are read by the request from each
receiver 17A, etc., they are decoded in a signal decoding part 13A, etc., and the
video, sound and character signals are transmitted to the requested receiver.
